

OKPOS - Terpenoidi

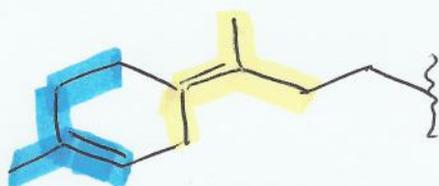

ZADATAK sa 7. slajda

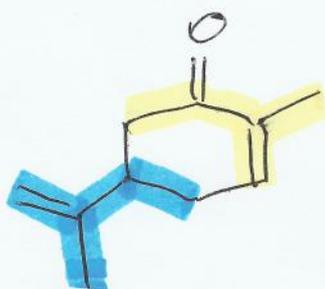

β -bisabolen

SESKVITERPEN

možće i :

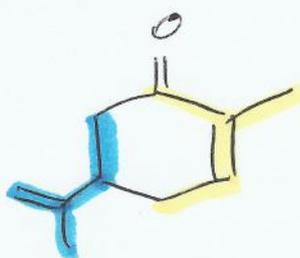

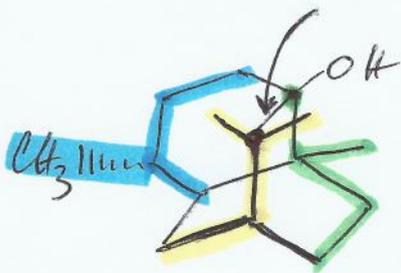

→ nije u skladu s
mehanizmom biosinteze
(slajd 13)

karvon
monoterpen

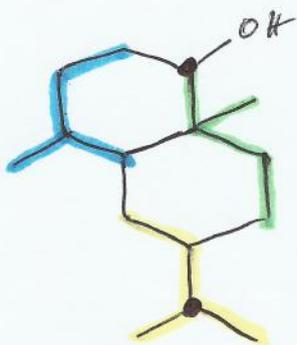

- i ovdje je moguće odabrati terpenске
jedinice na drugi način, što ne bi bilo
u skladu s biosintezom:

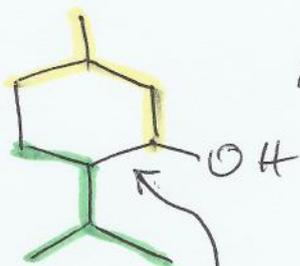

počuli alkohol
SESKVITERPEN

Kako smo došli do toga? Idemo razširiti
našu omotanu stranicu:

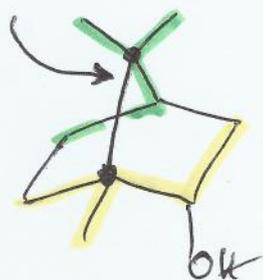

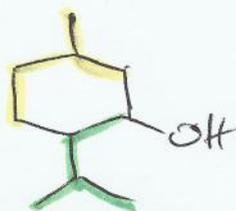

→ struktura jako podjednaka sa
 β -selinen (v. slide 4) pa
raspored izoprenskih jedinica
može biti jednak (velika je
vjerovatnost da je biosintetički put
identičan)

IZADATAK sa 15. slide

mentol

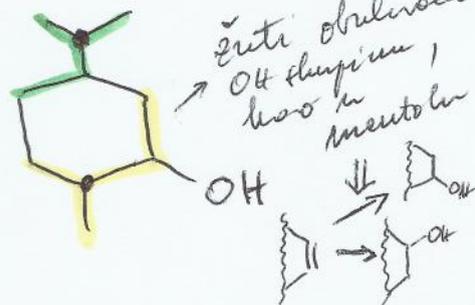

ova dva
mesta radije,
stoga je mogućnost
nizje pogrešne:

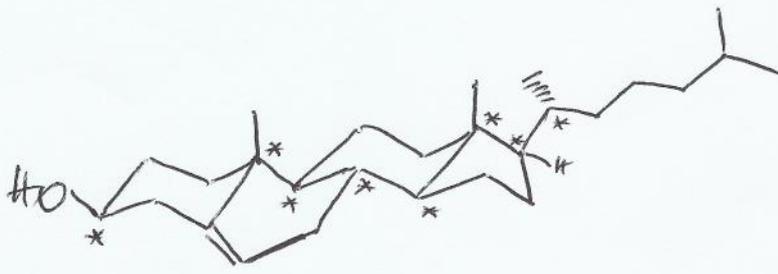

borneol

Možemo li prepoznati
strukturne značajke koje
smamo kod mentola?

→ DA, što percipiramo omotanu
našu

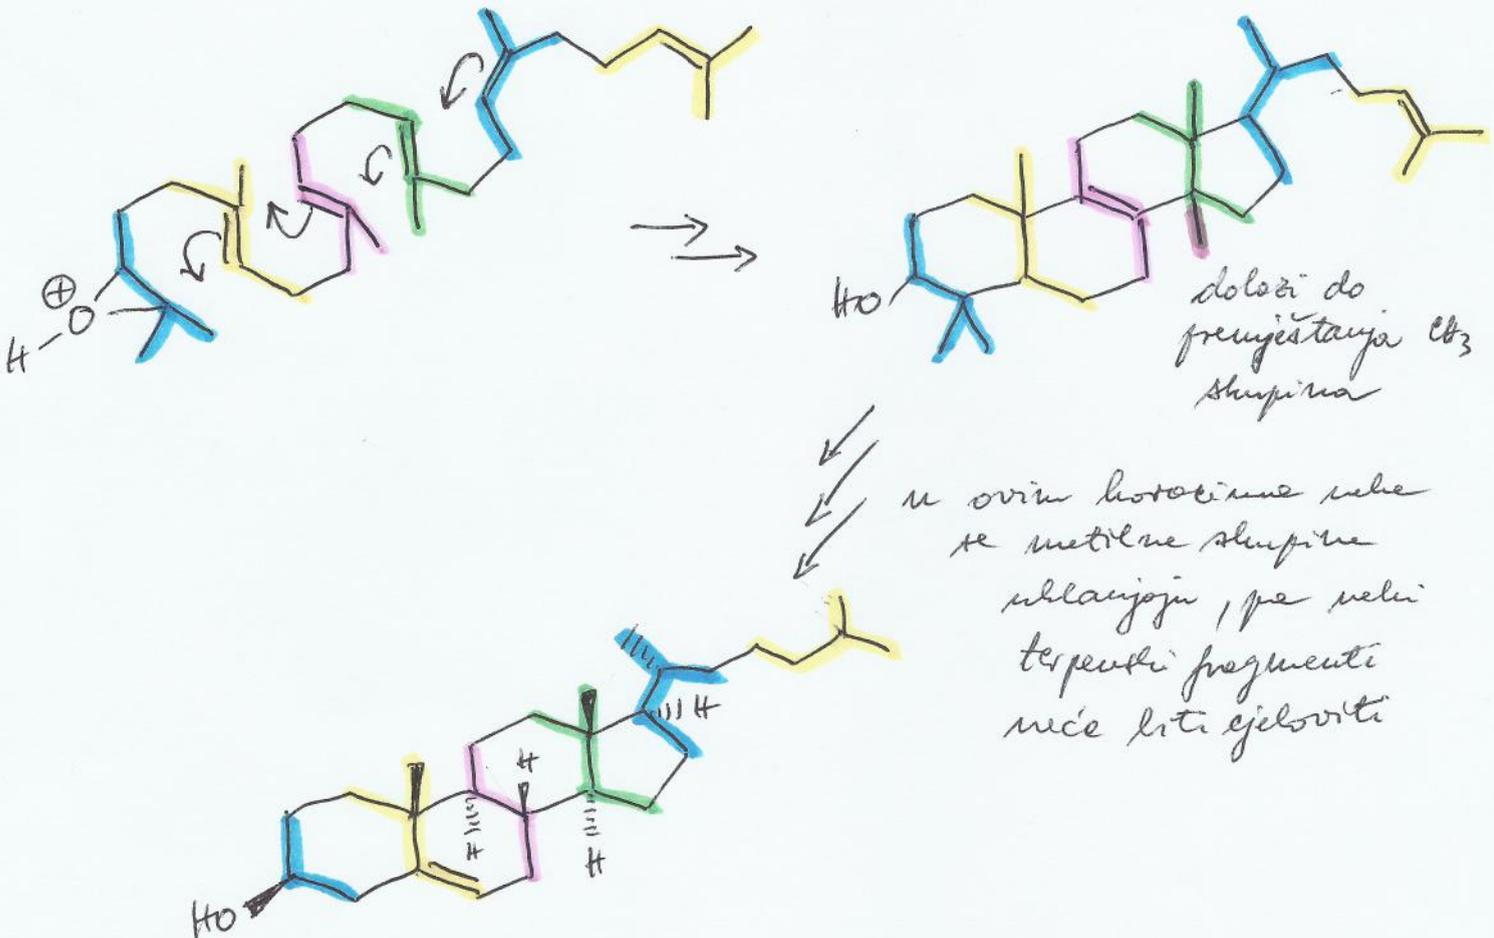

ZADATAK - 25. slide

$2^8 = 256$ mogućih stereoisomera

DOMAĆA ZADACIA

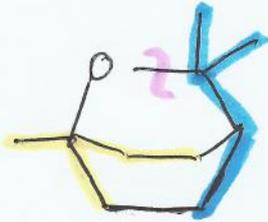

1.

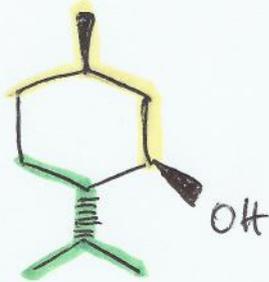

2.

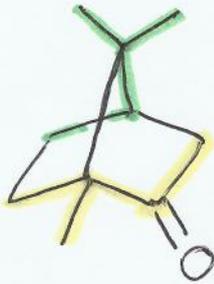

DEKAN
nije terpen

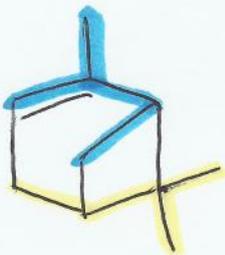

eukaliptol

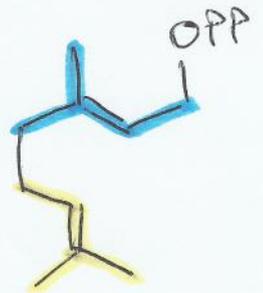

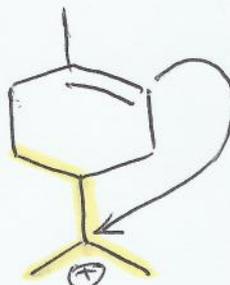

mentol

kamfor - za pojašnjenje vidjeti
Zadatak s borneolom
(2. str.)

α -pinen

detaljnije na 12. slajdu
